

EFFECTIVENESS EVALUATION OF ORGANIZATIONAL AND ECONOMIC MECHANISMS SUSTAINABLE DEVELOPMENT

Rybnikov A.M., Rybnikov M.S.

The paper analyzed the nature and components of organizational and economic mechanism for sustainable development. In the mechanisms for ensuring environmentally

sustainable development is the necessity of balancing measures and mechanisms to prevent hypertrophic manifestations in some regions in the economic achievements, as well as in natural-destructive actions. Based on this proposed two criteria for evaluating the effectiveness of sustainable development, which take into account the convergence of regional development in the overall economic system of the country - namely, the criterion of "the negative impact of economic development on the quality of the environment should be minimized" and "criterion of regional ecological-economic convergence" . Justified the development of the idea of sustainable development in view of convergence within the country in economic, social and environmental areas, since poorer regions grow faster than the economically developed regions. Over time, initially depressed economic regions catch up with the leaders of both absolute and relative terms. The presence of environmental convergence of regional development testifies to the effectiveness of environmental management and environmental protection. On the basis of the criteria considered by the scheme of improving the efficiency of organizational and economic mechanism for sustainable development. The above criteria are "negative impact of economic development on the quality of the environment should be minimized" and "criterion of regional ecological-economic convergence" does not exhaust the base criteria for the study of mechanisms of sustainable development, but their application will be able to identify problem areas in the management and regulation of the balanced development of regions of Russia.

Keywords: organizational and economic mechanism, sustainable development, ecological and economic convergence criteria of efficiency
